

Direct Mount Hurricane Screens

Known worldwide for strength and durability, flexible polypropylene hurricane screens are the original patented fabric hurricane protection system. Ideal to protect very large spans such as lanais and garages from flying debris, this flexible fabric is also the perfect solution for custom architecture, contemporary artwork and free-standing exterior structures. Hurricane screens are lightweight and fold easily to be tucked into a convenient flexible fabric tote that can be stored in a shed, bin, or garage.

WHY CHOOSE DIRECT MOUNT HURRICANE SCREENS?

Polypropylene fabric blocks UV rays while still allowing light to enter, eliminating long-term “boxed in” effects, allowing you to view the surroundings of your property safely from inside. This powerful protection option can be quickly and easily deployed manually without handling awkward or heavy panels. The added ability to unzip a screen panel in a patio door or garage is a major benefit to securing your property while maintaining access to the outdoors.

HOW TO DEPLOY DIRECT MOUNT HURRICANE SCREENS

These versatile flexible fabric systems are available with several deployment options that include fastening grommets to studs, or buckle and straps to studs. Buckle and strap for larger openings (lanai 24 ft.). Higher elevation openings can easily be deployed without a ladder from inside your home.
